1st Part:(name and project topic with title):

Name	Student-ID
Satya Vara Prasad Namala	11710975
Bonam Venkata Sri Sai Kanaka Raju	11704943
Goparaju Vijay Venkatrao	11686564
Bala phaneendra pothuri	11689374
Lasya madige	

1) **Bonam Venkata Sri Sai Kanaka Raju**
   Proposed Project: To make elections in an university or any other platforms easier we can build a web based voting application where the data is stored and updated in the data base in real time.
   Topic Title:" Online voting system"
2) **Goparaju Vijay Venkatrao**
   Proposed project: To improve the banking facilities by implementing one time text messages and emails to the user in order to reduce the frauds.
   Topic Title: "Online banking system."
3) **Bala phaneendra pothuri**
   Proposed Project: To make the food delivery apps available to all we can build a online orders based food delivery app where we can store the entire data and read write operations based on real time.
4) **Satya Vara Prasad Namala**
   Proposed project : Implementing data navigator for small scale enterprises to increase their productivity for the tasks like attendance, leaves, salary, personal info accessing Where the data is stored in the format of jpgs and also to update the info regarding the employees and raising requests with in the data base.
   Topic Title: "**SmallBiz Navigator**".
5) Laasya madige:
   Proposed project: developing beauty product website for the ease of access to the beauty products.
   Topic title: "beauty product management system".

2nd topic: (project selection,data base topic):
My self Satya Vara Prasad Namala, as the team coordinator I chose the final topic as follows:
Finally we are selecting the "**SmallBiz Navigator**".
CHOICE OF DBMS:
I can choose RDBMS:

- MYSQL which is an open-source RDBMS ideal for smaller to mid-sized organizations with cost constraints.

we fixed a suitable name for our Final Project as "**SmallBiz Navigator**". This means it can guide the small-scale businesses towards success.

3) A general description of the objectives and scope of your database system.

If we go back to the past days, we can find so much paperwork for the sack of small scale business like a dairy products based business or some kind of bakery business like that. There we can observe that people were manually updating their attendance people here are employees of that particular business. And if they need any leave due to a reason, they have to write letters and stuff to get their leave granted. But now even though they got laptops and personal computers for their business they dont have any softwares to run their business in a peaceful manner. So introducing a software which can handle their small needs like leave management and also attendance and salary along with holidays.

It can benefit for the Employee Information Management, Payroll and Compensation Management, Time and Attendance Tracking, Performance Management, Succession Planning, Data Security and Access Control.

The scope of an **SmallBiz Navigator** can vary depending on the organization's size, industry, and specific needs. Implementing an effective **SmallBiz Navigator** can enhance small scale operations, improve decision-making, and contribute to overall organizational success.

USER requirements can be as follows:

- as an admin I am able to approve or reject a leave request.
- as an admin I can delete or add an employee.
- as an admin I can view the attendance report.
- an employee cannot have to access to his or her own attendance report or can control it.
- each employee should have their own salary details provided by the admin.
- as a user I need to create my own account for the future logins and to access my personal information.

OUR PROJECT AIMS FOR THE SMALL-SCALE INDUSTRY LEVEL PERFORMANCE INCLUDING ALMOST OF THE TASKS INVOLVED IN THE ENTERPRISE.

6) **CHOICE OF DBMS:**

I can choose RDBMS:

- MYSQL which is an open-source RDBMS ideal for smaller to mid-sized organizations with cost constraints.

AS A PROJECT CORDINATOR I SELECTED THIS PROJECT CAUSE OF, HERE IN THIS PROJECT MOST OF THE DBMS QUERIES MIGHT GET INVOLVED AND ALSO WE GET TO LEARN ABOUT THE NEW FEATURES LIKE STORING PICTURES AND UPDATING THE DATA ACCORDING TO THE REAL TIME READ AND WRITE OPERATIONS. AND IT IS USE FUL TO MANY SMALL SCALE AND MEDIUM SCALE INDUSTRIES.
